

Configure Your iPhone's Mobile Wi-Fi Hotspot

There may be times when you need to connect your laptop or tablet to the Internet, but there is no Wi-Fi or wired network available. With your iPhone, however, you could have access to an instant Wi-Fi hotspot of your very own! This how-to will show you how to do this.

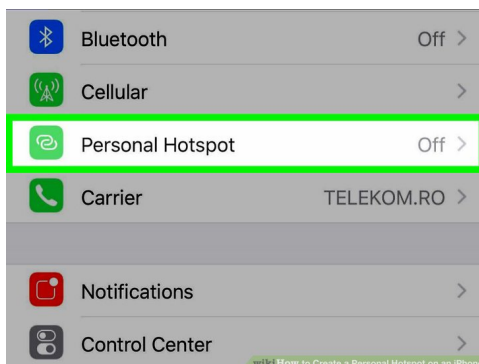

Setting Up a Hotspot

1. **Open Settings.** Tap the Settings icon, usually located on the Home screen, to open the Settings control panel.

2. **Enable Cellular Data (LTE) service, if you haven't had done so already.** You won't see the following option if your iPhone was sold as a prepaid plan since these companies often leave this setting turned off until several minimum data payments have been made to keep your data service active. iPhone's sold as prepaid plans through third-party offerings often leave LTE service off until they can be assured you can keep data service on the phone with applicable money for a set period. Tap Cellular in your Settings, then tap the toggle switch next to Cellular Data. If you see this switch turn green (or was green already), look just below this for a second check for the Personal Hotspot option.

3. **Get back to your main settings screen.** Tap the "< Settings" button in the top left corner.

4. **Tap Personal Hotspot.** If you have enabled "Personal Hotspot" from your wireless provider, you will see the Personal Hotspot icon in the first group of settings. •Note: If you have not enabled this service from your wireless provider, you must do so before proceeding. Visit your carrier's website and find the service that best suits your needs and budget.

5. **Turn on Personal Hotspot.** Tap the toggle switch at the very top of the "Personal Hotspot" control panel to enable Wi-Fi sharing.

6. **Set a password.** The current password is listed in plain text. If you've just set up your service plan with your wireless provider, there will be a default password in place. To change it, tap the Wi-Fi password button, enter a new password, then click "Done." You can also just leave the default password as-is. Make sure you note it for future use.
